Abstract: In this paper is presented a very efficient method for constructing Hadamard matrices, using binary code products. We will construct such matrices using the scalar production of two vectors and the tensor production of Hadamard matrices. This method is based on the representation of the natural number as a binary code which takes only two values 0 or 1. Such a method of generating Hadamard matrices can be used in practice to generate different codes, in telecommunication systems, to correct blocked codes, but also in science as for example in Boolean algebra.

Keywords: Hadamard matrices, binary code, scalar product, tensorial

product. 1 INTRADUCTION

Definition of Hadamard matrix:[8] A Hadamard matrix of order n , is $n \times n$, a square matrix with elements $+1$'s and -1 's such that $H \cdot H^T = nI$, where I is the identity matrix of order n .

Definition 2. [3] The Hadamard matrix which has all the elements (components) in the first row and column 1 is called the normalized Hadamard matrix.

Examples of the normalized Hadamard matrix of order 2 and 4:

$$H_2 = \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \quad H_4 = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \end{bmatrix}$$

If $\mathbf{a} = (a_1, a_2, \dots, a_n)$ and $\mathbf{b} = (b_1, b_2, \dots, b_n)$ are

vector over $\mathbb{F}_2$, then, scalar product defined: $\langle \mathbf{u}, \mathbf{v} \rangle = (\mathbf{u}, \mathbf{v}) = \sum_{i=1}^n u_i v_i$,
 $\langle \mathbf{u}, \mathbf{v} \rangle = \sum_{i=1}^n u_i v_i, \dots \langle \mathbf{u}, \mathbf{v} \rangle = \sum_{i=1}^n u_i v_i$. [9]

The Kronecker product also called tensor product or the direct product of two matrices $\mathbf{A} \otimes \mathbf{B}$ is defined as follows:

$$\begin{pmatrix} \mathbf{A}_{11} \otimes \mathbf{B} & \mathbf{A}_{12} \otimes \mathbf{B} \\ \mathbf{A}_{21} \otimes \mathbf{B} & \mathbf{A}_{22} \otimes \mathbf{B} \\ \vdots & \vdots \\ \mathbf{A}_{m1} \otimes \mathbf{B} & \mathbf{A}_{m2} \otimes \mathbf{B} \end{pmatrix}$$

For example,

$$\begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} \otimes \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \end{pmatrix}$$

3 CONSTRUCTION OF THE BINARY CODES

For the construction of Hadamard matrices using binary codes, we will give a field, based on which we can define the elements of the Hadamard matrix.

Lemma 1.[5] Let u_i and v_j be binary codes of length n and m respectively, then:

$$\sum_{i=1}^k (u_i, v_j)$$

$$\sum_{i,j} \binom{r}{1} \binom{r}{1} 0_{ij} = \sum_{i,j} \binom{r}{1} \binom{r}{1} 0_{ij} [1]$$

For $(\blacklozenge\blacklozenge,\blacklozenge\blacklozenge) = (\blacklozenge\blacklozenge,\blacklozenge\blacklozenge)$ we have:

$$\binom{r}{1} \binom{r}{1} \binom{r}{1} 2210101010 H i, j H i i \dots i, j j \dots j H i \dots i, j \dots j n = n k k - k k - = - n k - k -$$

Using the inductive assumption we will have:

$$2^k - \dots - \sum_{i,j} \binom{r}{1} \binom{r}{1} \binom{r}{1} 1 \binom{r}{1} 0 \binom{r}{1} 0$$

$$n H i j \binom{r}{1,1} = \dots = \dots = \dots = \dots$$

The construction through lemma 1 is realized as follows:

We get all binary $\blacklozenge\blacklozenge$ -sets $u_1 u_2 \dots u_k$. The order of the binary -s will be denoted by that taken from the binary -s, adding 0 first as the component after and then 1, which are elements of $[0,1]$. So if, $\pi_i = [\dots]^i$, then:

$$\pi_i = [u_1 0, u_2 0, \dots, u_2 0, u_1 1, u_2 1, \dots, u_2 1], \forall i \in \{1, 2, \dots, k-1\}$$

For exmple,

$$\begin{aligned} \diamond \diamond \diamond \diamond &= [\diamond \diamond, \diamond \diamond], \diamond \diamond \diamond \diamond = [\diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond], \diamond \diamond \diamond \diamond = \\ &[\diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond, \\ &\diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond] \end{aligned}$$

$$\begin{aligned} &\diamond \diamond \diamond \diamond = \\ &[\diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \\ &\diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \\ &\diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond, \\ &\diamond \diamond \diamond \diamond \diamond \diamond \diamond \diamond] \end{aligned}$$

Let ^k
 $n = 2$, and let $\diamond \diamond \diamond \diamond$ -sets under the proper binary ranking as follows:

$$\begin{aligned} &[\]_{0121} \\ &, , ..., \pi_k = u u u u^{n-}. [5] \end{aligned}$$

We will use this indexing to find the elements, and that is why we start the indexing of 0. For example for binary sets we will have:

with elements (⁽⁾

Dec	Hex	Bin
0	0	0000
1	1	0001
2	2	0010
3	3	0011
4	4	0100
5	5	0101
6	6	0110
7	7	0111
8	8	1000

Matrix,

9	9	1001
10	A	1010
11	B	1011
12	C	1100
13	D	1101

14	E	1110
15	F	1111

$$H = (h_{ij})_{n \times n}$$

$$h_{ij} \in \{0, 1, \dots, 1\}$$

$$h_{ij} = \sum_{k=1}^n u_i u_j \pi_k$$

, is a H-matrix of order

$n = 2$. As a concrete example we will examine $k = 4$ meaning that we will construct the H_k matrix of order 16, then H_{16} . [5]

Since $u_0 \leftrightarrow 0000$, then it follows that $(u_0, u_i) = (u_j, u_0) = 0, \forall i, j \in \{1, 2, \dots, n-1\}$ comes from $h_{0i} = h_{j0} = +1$. h_{ij} will also be $+1$ or -1 depending on the weight $\omega(u_i)$, where u_i is an even or odd number (number of members 1).

So,

$$h_{3,3} = h_{5,5} = h_{6,6} = h_{9,9} = h_{10,10} = h_{12,12} = h_{15,15} = +1,$$

whereas,

$$h_{1,1} = h_{2,2} = h_{4,4} = h_{7,7} = h_{8,8} = h_{11,11} = h_{13,13} = h_{14,14} = -1.$$

Other elements of the matrix are similarly assigned, such as:

$$h_{1,3} = +1, \text{ because } (u_1, u_3) = (0001, 0011) = (00000001, 00000011) = 0000 \cdot 0001 + 0001 \cdot 0000 + 0001 \cdot 0001 + 0000 \cdot 0011 = 0001 \text{ and } (-0001) \cdot 0001 = 0001.$$

$$h_{1,5} = -1, \text{ because } (u_1, u_5) = (0001, 0101) = (00000001, 00000101) = 0000 \cdot 0101 + 0001 \cdot 0100 + 0001 \cdot 0001 + 0000 \cdot 0101 = 0000$$

and $(-0001) \cdot 0101 = 0001$, etc. [1]

So the H-matrix constructed in this way will look like this:

$$\begin{pmatrix} 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 & 1 & -1 & 1 & -1 \\ 1 & 1 & -1 & 1 & -1 & 1 & -1 & 1 \\ 1 & -1 & 1 & -1 & -1 & 1 & -1 & 1 \\ 1 & 1 & -1 & -1 & 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & 1 & -1 & -1 & 1 & 1 \\ 1 & 1 & 1 & -1 & 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & 1 & -1 & 1 & -1 & 1 \end{pmatrix}$$

Now for practical reasons, in the above matrix, we will substitute, 1-s with + and 0-s with -, from where we get the matrix:

A more complete explanation of the construction of Hadamard matrices with the binary code

$$\begin{array}{c} \{\} \\ k i n \\ \in - \forall = - \end{array}$$

$$i = \min_{1 \leq i \leq n} \{1, 1, 0, 1, 2, \dots, 1\}$$

where $\log_2 N$.

$$\sum_{i=1}^n \epsilon_i = -\infty$$

Step 3: [1]

$$h_{km} = \sum_{i=0}^{k-1} \epsilon_i$$

$$(i - e - 0 \oplus 0 = 0, 0 \oplus 1 = 1 \oplus 0 = 1 \text{ dhe } 1 \oplus 1 = 1)$$

Example. We know that the Hadamard matrix of order 2

$$H_2 = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$$

The Hadamard matrix of the order $N = 2$ is taken from the matrix:

$$H(1) = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix}$$

All elements of the Hadamard matrix of the order $N = 2$, $h_{0,0}, h_{0,1}, h_{1,0}, h_{1,1}$ can be found using the following binary codes:

First, we get $k, m = 0, 1$ binary numbers: $(k)_2 = 0$ and $(m)_2 = 1$. Then we apply the formula

$$h_{k\,m}^{(1)} = \sum_{i=0}^n \binom{n}{i} (-1)^i$$

as follows:

$$h_{k\,m}^{(1)} = \sum_{i=0}^n \binom{n}{i} (-1)^i = \dots = (-1)^n$$

$$h_{k\,m}^{(2)} = \sum_{i=0}^n \binom{n}{i} (-1)^i = \dots = (-1)^n$$

$$h_{k\,m}^{(3)} = \sum_{i=0}^n \binom{n}{i} (-1)^i = \dots = (-1)^n$$

$$h_{k\,m}^{(4)} = \sum_{i=0}^n \binom{n}{i} (-1)^i = \dots = (-1)^n$$

Substitute the above equations into equation (1) and obtain:

$$H_2 = \dots$$

$$=_{1 \ 1}$$

The Hadamard order $N = 4$ matrix can be constructed using binary codes. The Hadamard matrix of the order $N = 4$ is given in the form:

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 \\ 1 & 1 & -1 & -1 \\ 1 & -1 & -1 & 1 \end{bmatrix}$$

$$\begin{matrix} 00 & 01 & 02 & 03 \\ h & h & h & h \end{matrix}$$

$$H(2)$$

$$\begin{matrix} 4 \\ = \\ 10 \ 11 \ 12 \ 13 \end{matrix} \begin{matrix} h & h & h & h & h & h & h & h \\ 20 & 21 & 22 & 23 & 30 & 31 & 32 & 33 \end{matrix}$$

$^2 N =$ matrix can be constructed as follows:

The Hadamard order $2 \ 4$

First we get binary codes k, m :

$$\begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} = 0, 0^b, \begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = 0, 1^b, \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} = 1, 0^b, \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = 1, 1^b$$

then, we assign the elements of the matrix H_4 .

To determine the elements of matrix H_4 we use the formula:

$$h_{k \ m} = \sum_{i=0}^{n-1} (-1)^{\oplus ii} \begin{matrix} 1 \\ 0 \end{matrix}$$

We have:

$$= - \sum_{i=0}^1 = - = - = - = - = \begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

$$h \ h$$

$$\begin{matrix} k \ m \\ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0 \end{matrix} \oplus \oplus \oplus \oplus$$

$$1 \ 1 \ 1 \ 1 \ 1 \ 1$$

$$\begin{matrix} 00 & 0,0 & 0,0 \\ ii & = & \oplus \end{matrix}$$

$$= - \sum_{i=0}^1 = - = - = - = - = \begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix}$$

$$h \ h$$

$$\begin{matrix} k \ m \\ 0 \ 0 \ 0 \ 1 \ 0 \ 0 \ 0 \ 0 \end{matrix} \oplus \oplus \oplus \oplus$$

$$1 \ 1 \ 1 \ 1 \ 1 \ 1$$

$$\begin{matrix} 01 & 0,0 & 0,1 \\ ii & = & \oplus \end{matrix}$$
